

In the claims:

For the Examiner's convenience, all pending claims are presented below with changes shown.

1. (Previously Presented) A device, comprising:  
  
a scheduler in an access point to provide a schedule of packets to transmit on each of M spatial channels to M stations during a time interval by arranging variable length packets to fill each of the M spatial channels during the time interval based on the transmission times for different packet lengths of each of the variable length packets,  
  
where M is a constant less than or equal to a number of antennas at the access point.
2. (Original) The device of claim 1 further including adaptive antenna arrays used in conjunction with a beam forming algorithm to achieve spatial diversity and implement Spatial-Division Multiple-Access (SDMA), wherein the adaptive antenna array changes beam weights based on the schedule.
3. (Original) The device of claim 1 wherein the scheduler in the downlink provides the schedule of transmission intervals for different mobile stations.
4. (Original) The device of claim 1 wherein the schedule accounts for traffic information to the mobile stations based on packet size.
5. (Original) The device of claim 1 wherein the schedule accounts for traffic information to the mobile stations based on queue size.
6. (Original) The device of claim 1 wherein the schedule accounts for traffic information to the mobile stations based on priority.

7. (Original) The device of claim 1 wherein the access point sends multiple schedules in a protected time interval to the mobile stations.
8. (Original) The device of claim 7 wherein a first schedule of the multiple schedules is sent to a first mobile station and a second schedule is sent to a second mobile station.
9. (Original) The device of claim 1 wherein the access point fills spatial channels using the data packets buffered for all the mobile stations.
- 10-25. (Canceled)
26. (Previously Presented) A method for a Medium Access Control (MAC) protocol, comprising:
- providing a schedule of packets to transmit on each of  $M$  spatial channels to  $M$  stations during a time interval by arranging variable length packets to fill each of the  $M$  spatial channels during the time interval based on the transmission times for different packet lengths of each of the variable length packets,
- where  $M$  is a constant less than or equal to a number of antennas at the access point
27. (Original) The method of claim 26, further including: retrieving antenna resources in the access point to form spatial channels developed on the fly for a waiting mobile station.
- 28-29. (Canceled)
